

# Drought Status Update

## December 2010

### Short-term Drought Status Update

December was a little drier than normal across Arizona, due to the La Niña circulation pattern that tends to block precipitation across the southern states. This resulted in worsening drought conditions across southern and southwestern Arizona. Two winter storms brought heavy rain and snow to central and northern Arizona and some light showers across the southern counties. The heavy rain and snow in the north improved drought conditions in Mohave, Yavapai, and western Coconino counties. Yuma and La Paz counties remain abnormally dry. Although the recent strong storms caused flooding in northwest Mohave County, the moisture has been welcome across the northern and central counties. Any precipitation is beneficial as drier than normal conditions are forecast for the rest of the winter.

Summary produced by the State Drought Monitoring Technical Committee  
January 11, 2011.
