

Drought Status Report

February 2015

Significant precipitation across northern Arizona in late February and early March led to improvement from extreme drought (D3) to severe drought (D2) in the Chuska Mountains of Apache County, and improvement from severe drought (D2) to moderate drought (D1) in northern Navajo, Coconino and Mohave counties.

Further south, near Flagstaff in southern Coconino County, and in central and southern Yavapai County, relatively warm and dry conditions in February have led to some worsening drought with an increase in moderate drought (D1) during the past month.

Central and southern Arizona have had no changes in drought conditions since the end of January.

Summary produced by the State Drought Monitoring Technical Committee—March 6, 2015.
